

- 1st Code Smell:
 - **Code Smell Type:** Duplicated Code
 - **Classes involved:** ContactList and ItemList
 - **Methods involved:** public boolean saveContacts(Context context) and public boolean saveItems(Context context)
 - **Description:** Both method above have very similar implementation and execute a the same action on a different object
 - **Solution:** Create a storage handling class to hold such kind of implementations

- 2nd Code Smell:
 - **Code Smell Type:** Excessive use of Comments
 - **Classes involved:** EditContactActivity
 - **Methods involved:** public void saveContact(View view)
 - **Description:** This method has 4 lines of comment for 11 lines of code, more precisely in a single block of code of 4 lines of code its related do two lines of comment. This means that the implementation could be improved, to reduce the amount of comments needed to explain the code functionality
 - **Solution:** Several kinds of refactor could be applied, one example is the creation of a private method to verify if the user name inputted it already exists
